SEAFOOD PRODUCTS

Application

Strict maintenance of food safety in commodities is required of mass-producing food manufacturing companies, especially the ones that are involved in exportation. Recognizing this as a priority, Seachamp conducts testing in various stages of production - from the raw materials to the finished products - as well as for environmental monitoring. The competitively-priced CompactDry™ helps Seachamp enhance its testing capacity as it offers a shorter incubation period without compromising accuracy of results, allowing the release of products to the market immediately.

Seachamp's world-renowned seafood products are tested using CompactDry™ for Aerobic Count (TC), *Salmonella* (SL), *E. coli* / Coliform (EC), and *Staphylococcus aureus* (XSA).

Validation

E. coli / Coliform

Aerobic count

S. aureus

Produced to detect highly targeted microorganisms, Nissui CompactDry™ is approved and validated by international accrediting bodies, the AOAC International, MicroVal, and NordVal International. CompactDry™ plates can be used for end-product testing of solid and liquid samples, membrane filtration, surface sampling, hand swabbing, and air sampling.
